

Table 1: Participant exclusions from the collected survey responses.

Exclusion reason	<i>n</i>
Did not complete the study	211
Low-quality completed response identified through manual review	1
Total excluded	212
Final analytic sample	1,201

Completed responses were manually reviewed for response quality. One response was excluded because it gave the same or nearly identical short answers across multiple open-ended questions, provided little substantive content, and had an unusually short completion time. The remaining exclusions were incomplete survey responses.

Prolific eligibility filters were applied before participants entered the study and are therefore not included in these exclusion counts.
